Hello and welcome to the *Kabetogama Sanitary Sewer Collection and Treatment Project Status Update*. In this and later issues, we will be updating you periodically on the status of this project.

Happening Now

Now that summertime is here, we hope many of you are back in the Lake Kabetogama area and are enjoying your cabins and the warm weather. We are looking forward to continuing our efforts this summer and fall to collect data for completing our design of this project.

Many of you have already filled out a Temporary License Form, but for anyone that has not, we have included a copy with this letter for each property owner to review and sign. This form will grant only temporary permission for essential work and survey data collection to be carried out on your property, which is crucial for progressing with the design of this project. We encourage all property owners to carefully review, sign, and return the temporary license forms at your earliest convenience. Forms can be electronically signed, or physically signed, scanned, and emailed to: cbruce@sehinc.com. We will then forward to the Township to complete the signing process.

SEH plans to be onsite on Wednesday, June 25, and Thursday, June 26, to walk the project area and talk to you about your properties and any questions you may have. We will have physical copies of temporary license forms with us for you to fill out and sign in person if you haven't already. We will do our best to cover as much of the project area as possible, however, we will likely have to return to complete this process and visit remaining properties at a later date.

As mentioned previously, work associated with the temporary license forms is scheduled to mainly occur this summer and fall. However, the forms grant temporary permission over the next three years, as we may also need to return in the future to collect additional information. Tasks include completing soil borings, soil sampling, and surveying. Taking soil borings will help us identify subsurface conditions of each property. This information will aid in the design of the proposed grinder stations and the piping to each property. Soil sampling is also necessary to complete the required archaeological study and work for the environmental review related to completing the project Facility Plan. Surveying will enable our team to map each property accurately and locate existing utilities, structures, and property pins.

Please look forward to additional project details in the upcoming Project Status Updates and do not hesitate to reach out if you have any questions.
